

IST 209 In-Class Lab #4

Write a Java program which would ask the user to enter a password which will be compared to the application-defined password, “**ByteBit**”. If the user enters the correct password (using a case-insensitive comparison) print the message “**Success**” and end the program. If the user types in the wrong password, print the message “**Try Again**” and ask the user to enter the correct password again.

Bonus: Continue asking the user to enter the correct password until they enter the correct password or type “**Quit**”. If the user types “**Quit**”, print out the message “**Better luck next time.**” and exit the program.
