

MGMT 380b Assignment #3

Create a Form Processing Page in PHP

Due 15 November 06

You must submit the URL for your payment information form through the class' website prior to the beginning of the lab on 15 November.

NOTE: this is an individual assignment, not a team project. All work is to be done individually and uploaded to your web page.

Your team's first project has been copied to your directory on the class' webserver. You will need to develop a PHP script which will process the data submitted by the payment information form created for your first project. Your team's project has been copied into the Project subdirectory in your directory for you to work from.

This script should display the results of what was submitted in an HTML table. All of the fields which exist on the original form need to be represented in the table you create. You will then ask the submitter of the form to confirm that the data that was submitted was correct and provide a button which they can click on to accept what was submitted. Consequently, the HTML that is generated will need to include a FORM HTML element and a SUBMIT button which the user will click on (you don't need to be concerned about the ACTION attribute of the FORM). The format of the generated HTML will need to be consistent with the format and presentation of the original HTML form (e.g. same color scheme, layout, fonts, etc.). Each field you are expecting to receive from the form should be checked for validity and displayed in the table.
